

Why shouldn't I use a home doppler?

If you saw someone collapsed in the street would you check their pulse and walk away?

Or would you call an ambulance?

The same goes for your baby, if you notice a change in your baby's regular pattern of movement, they could be unwell. Do not take the presence of a heartbeat that all is ok.

If your baby is unwell or in distress the only time something can be done is when there is a heartbeat.

When there is no heartbeat it is too late.

If you notice a change in your babies regular pattern of movement call your midwife.

Do not use your home doppler for reassurance

Feeling your baby move is a sign that they are well

When should I start to feel movement?

Most women usually begin to feel their baby move between 16 and 24 weeks of pregnancy. A baby's movements can be described as anything from a kick, flutter, swish or roll. The type of movement may change as your pregnancy progresses.

How often should my baby move?

There is no set number of normal movements. Your baby will have their own pattern of movements that you should get to know. From 16 - 24 weeks on you should feel the baby move more and more up until 32 weeks then stay roughly the same until you give birth.

What shall I do if I notice reduced movement?

If you think your baby's movements have slowed down or stopped, contact your midwife or maternity unit **immediately** (it is staffed 24 hours, 7 days a week). Do not put off calling until the next day to see what happens.

Do not worry about phoning, it is important for your doctors and midwives to know if your baby's movements have slowed down or stopped.

Do not use any hand-held monitors, dopplers, or phone apps to check your baby's heartbeat. Even if you detect a heartbeat, this does not mean your baby is well.

What if my baby's movements are reduced again?

If, after your check up, you are still not happy with your baby's movements, you must contact either your midwife or maternity unit straight away, even if everything was normal last time.

Never hesitate to contact your midwife or the maternity unit for advice, no matter how many times this happens.

Why are my baby's movements important?

A reduction in a baby's movements can sometimes be an important warning sign that a baby is unwell. Two out of three women who had a stillbirth noticed their baby's movements had slowed down or stopped.

It is NOT true that babies move less towards the end of pregnancy

You should continue to feel your baby move right up to the time you go into labour and whilst you are in labour too.
